In lights proposition is very important to find the right connection between **design and functionality.**

MAREKHAMRAK  
COMPLEX LIGHTNING PROPOSITIONS

# Lights proposition

Lights must **suitably match the interior design**, but also must produce **homogeneous light** which meets also the sanitary standards.

In the project XENEX I used lights (of which brand is Lira Lighting) where the manufacturer met my requirements concerning the dimensions and color of the lights.

# Cooperation with architects

## INSPIRATION AND IDEA

I follow trends in lighting sphere every day.

**When I work with architects I try to bring an inspiration and an idea to the project.**

Very often we find the solution together which brings the project, in clients eyes, to a higher level.

In the project for the XENEX company we worked in cooperation with ing. /arch. Peter Svorc & partners. When the proposition of lightning was made, I was able to bring to the project a **bring idea** which at the end brought to the project a unique realization.

# Functionality and design

In the entrance room I used design light BEE. The standard height of fabrication is 15 cm.

The manufacturer has changed the height and colour of the lighting for us.

Because of that a unique design was created which makes a interesting first impression when we walk in and in the some time brings enough light in to the room.

# Homogenous lighted ceiling

In one room I have chosen for homogenous lighting a lighted surface of 2 x 3 meters without any more of fixation/houlding elements.

**Even when the intensity of the light is reduced, the big surface is lighted equally.**

# Lighting of conference room

In conference room I chose lighting OVER LED, from which is possible to make a “infinity strip”.

The lighting/lamp insure a even/uniform light in the room and enough light for better working comfort.
